Benzene line: equipment, laboratory setup and staff training

Installation of benzene line and short training course (milestones)

(Installation and training take 10 days)

<u>Day 1.</u> Estimation of condition in lab, selection of place to work with equipment, beginning of installation of equipment (mounting and Set Up of benzene line). <u>Day 2.</u> Continuation with installation, some introduction in equipment. <u>Day 3.</u> Ending of installation, continuation of introduction in equipment, test of operation of equipment sub-sections, testing of heating of ovens. Testing of sample preparation procedures.

Day 4. and until the end. Active training:

- Wood sample > charcoal > carbide > acetylene > benzene > purification.
- Another wood sample > direct pyrolysis > carbide ...
- Use of different sample material advices in selection of appropriate technology steps.
- Sample pretreatment, use of appropriate sample mass. Work with complex samples.
- Simultaneous management of multiple samples on different stages of preparing of benzene.

Two days at the end:

- Checking of knowledge.
- Discussion of technologies used.
- Questions. Recommendations.

Lab before

Benzene line (in boxes)

Operation of conventional radiocarbon dating laboratory includes:

- <u>Arranging of Sample's inflow</u> it is up to you,
- Sample pretreatment we will give you ideas,
- <u>Production of benzene</u> we offer to you full package,
- <u>Handling of vials</u> we offer you excellent performances,
- Liquid scintillation counting we could give you introduction and some ideas,
- <u>Data processing</u> quench correction, multiple windows counting, etc.
